Production Facilities

We have a state-of-the-art machine park consisting of over **80 modern devices**, allowing for comprehensive processing of various materials. In addition to glass processing machines, we also have equipment dedicated to working with metal, wood, and plastic, enabling us to execute even the most demanding projects.

Sustainable Development

Our company's sustainability policy focuses on **achieving harmony between environmental, social, and economic aspects**. We strive to minimize our environmental impact by improving production processes and effectively managing resources. We promote equality and social responsibility by investing in innovations that enable the development of products and services in line with sustainable development principles.

Products

Custom-made Production

A key part of our business is **custom-made production**. We cooperate with retail chains and distributors to supply mirrors according to client specifications and with their logo. We also handle office, residential, and hotel projects. Our experienced engineering team and large production capacity allow us to meet the highest demands.

Personalized Equipment

Our clients have nearly full freedom to tailor mirror equipment to their needs. We offer dozens of types of **LED strips**, including CCT LED strips, which allow for color temperature adjustment from warm to cool light. COB LED strips, with high diode density, provide uniform, diffused light without visible points. We also offer waterproof LED strips (IP65 and IP67), perfect for bathrooms, where water resistance is crucial. We have LED strips in various color temperatures: 3000K, 4000K, and 6000K.

We use nearly twenty different **switches and controllers**, giving complete control over the mirror's lighting. Our range includes simple touch ON/OFF switches as well as advanced controllers that allow adjustment of not only light intensity but also its color – from cool to warm.

A foggy mirror in the bathroom is no longer an issue. **The electric heating mat**, installed on the back of the mirror, effectively prevents condensation from forming on its surface. We offer mats in various sizes and power ratings, allowing perfect fit for any mirror.

Concerned about safety? We offer special **certified protective film**, which, when applied to the back surface of the mirror, protects it from breaking and reduces the risk of injury in case of glass shattering.

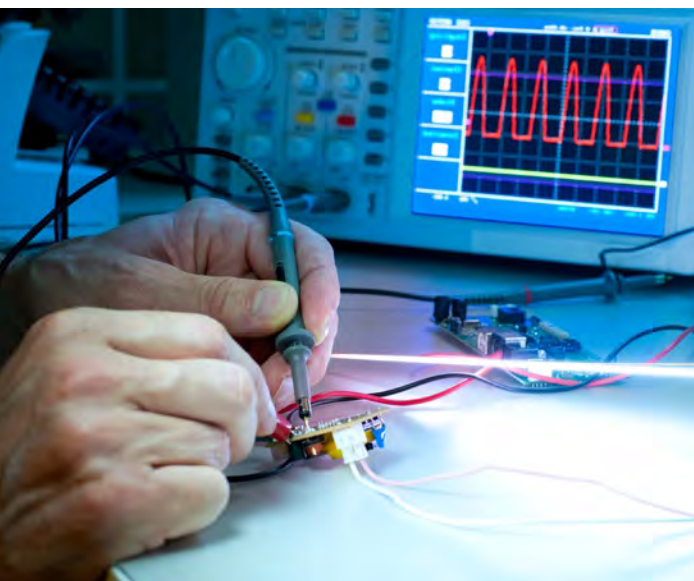

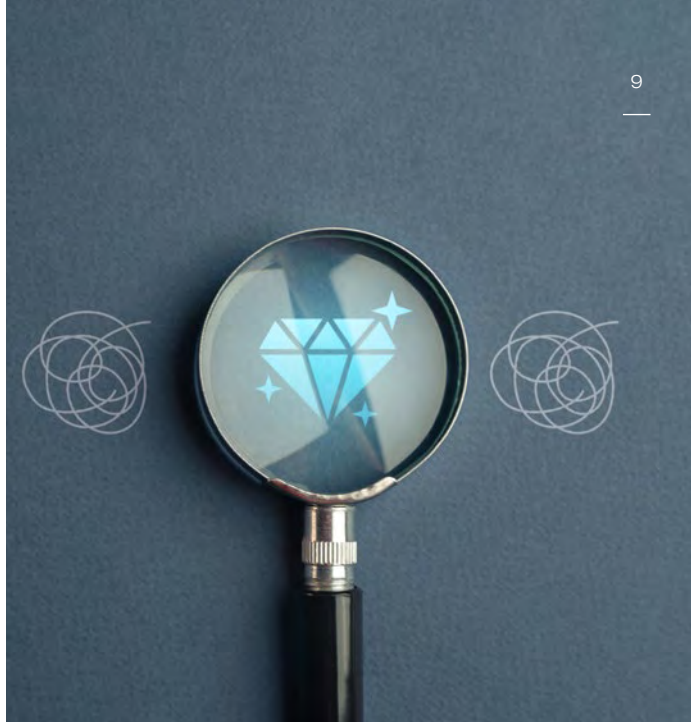

Mirrors in Aluminum Frames

We specialize in producing mirrors with aluminum frames. We have developed **several dedicated profiles** that allow us to create mirrors in various shapes, sizes, and colors, both with and without lighting. We possess **three lines for bending profiles**, enabling us to produce mirrors not only in classic rectangular shapes but also in round, oval, with rounded corners, and in irregular forms.

Quality

The high quality of our products is the result of precise design, careful production planning, and strict quality control at every stage. **Our quality control team** thoroughly inspects each product to ensure it meets customer requirements. We operate in compliance with European standards, including those related to electrical products. We have developed our own quality management system, which ensures the highest standards. Periodic **audits** confirm our ability to produce products of verified quality.

Testing and Certifications

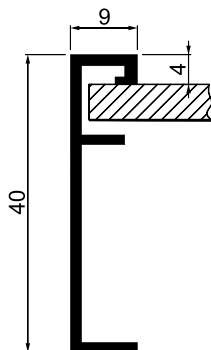

We regularly conduct testing and certification of both **components** used in production and **finished products**, which possess all necessary European certifications and approvals, including **LVD, EMC, ErP, and RoHS**. We have our own laboratory and also cooperate with leading laboratories and research centers in Poland and Europe. Our testing mainly focuses on **electrical components**, but we also verify other elements, such as mirror panes, hangers, and packaging.

Safety

Safe use of our products, especially mirrors with lighting, is our priority. We ensure that our products meet all standards, including those for electrical installations. Our mirrors are made in **Class II electrical protection** (design ensures that the electrical current does not come into contact with parts that could be touched by the user, eliminating the risk of electric shock) and with **IP44 or IP55 ingress protection** (guaranteeing appropriate protection for the electrical installation against water). Thanks to these solutions, our mirrors can be safely used in bathrooms.

Nico Classic collection

Bold and classic. A timeless collection of mirrors with frames based on a profile with a depth of **40 mm**. Its universal and sturdy construction allows for the creation of both illuminated and non-illuminated models, as well as mirrors with large dimensions.
